

# Clinical Genetics Introduction

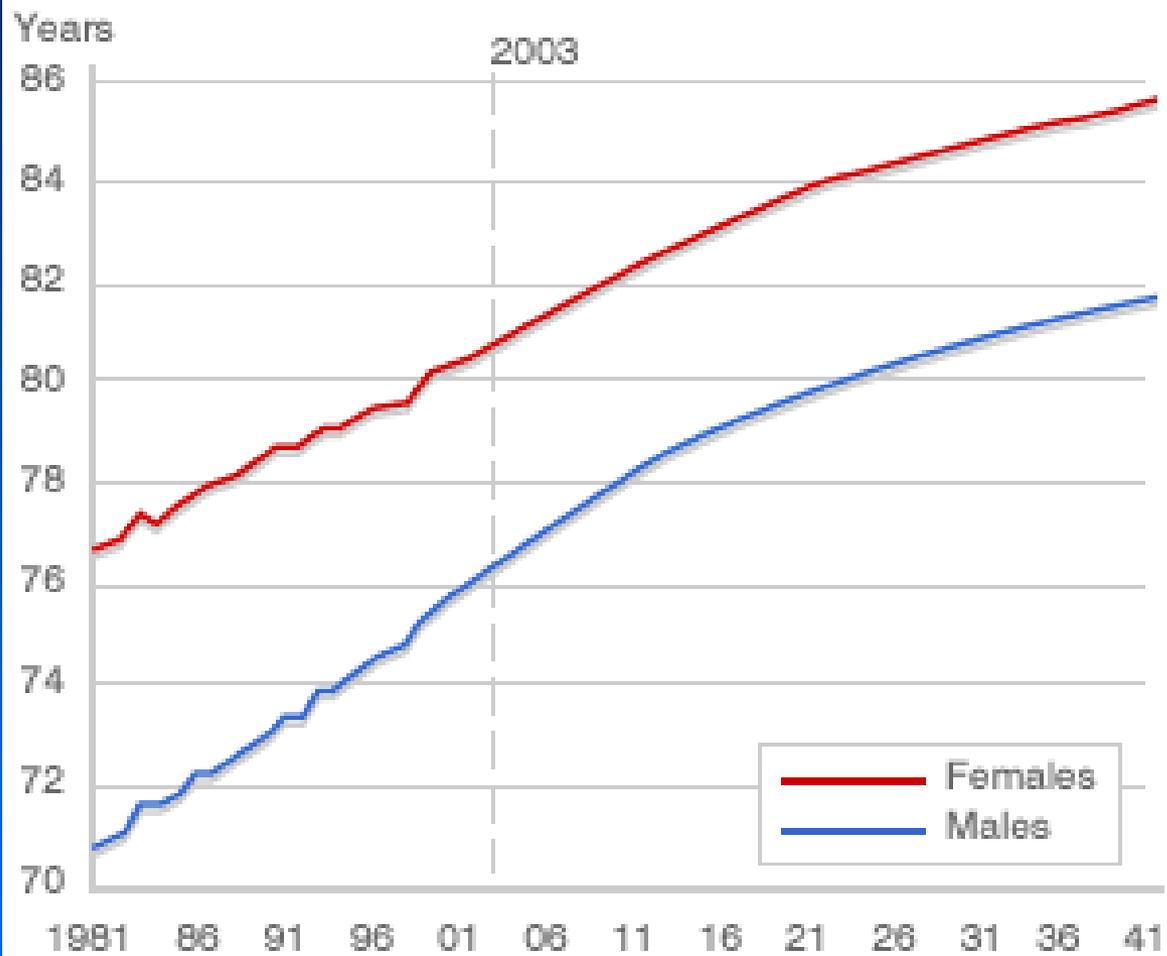

Wayne Lam

[wayne.lam@ed.ac.uk](mailto:wayne.lam@ed.ac.uk)

Rate per 1,000 live births

## Life expectancy at birth

Source: Government Actuary's Dept

Cohort expectation of life at age 65 according to historic and projected mortality rates, persons who reached age 65 1850–2050, England and Wales

# Introduction

**TABLE 1.3 ■ Approximate Prevalence of Genetic Disease in the General Population**

Type of genetic disease	Lifetime prevalence per 1,000 persons
Autosomal dominant	3 to 9.5
Autosomal recessive	2 to 2.5
X-linked	0.5 to 2
Chromosome disorder*	6 to 9
Congenital malformation <sup>†</sup>	20 to 50
Total	31.5 to 73

# Introduction

**TABLE 1.2 ■ Percentages of Childhood Deaths in United Kingdom Hospitals Attributable to Nongenetic (e.g., Infectious) and Genetic Causes**

Cause	London 1914	London 1954	Newcastle 1966	Edinburgh 1976
Nongenetic	83.5	62.5	58.0	50.0
Genetic				
Single gene	2.0	12.0	8.5	8.9
Chromosomal	—	—	2.5	2.9
Multifactorial	14.5	25.5	31.0	38.2

## Clinical Genetics Module

*Lectures and Tutorials  
Handbook*

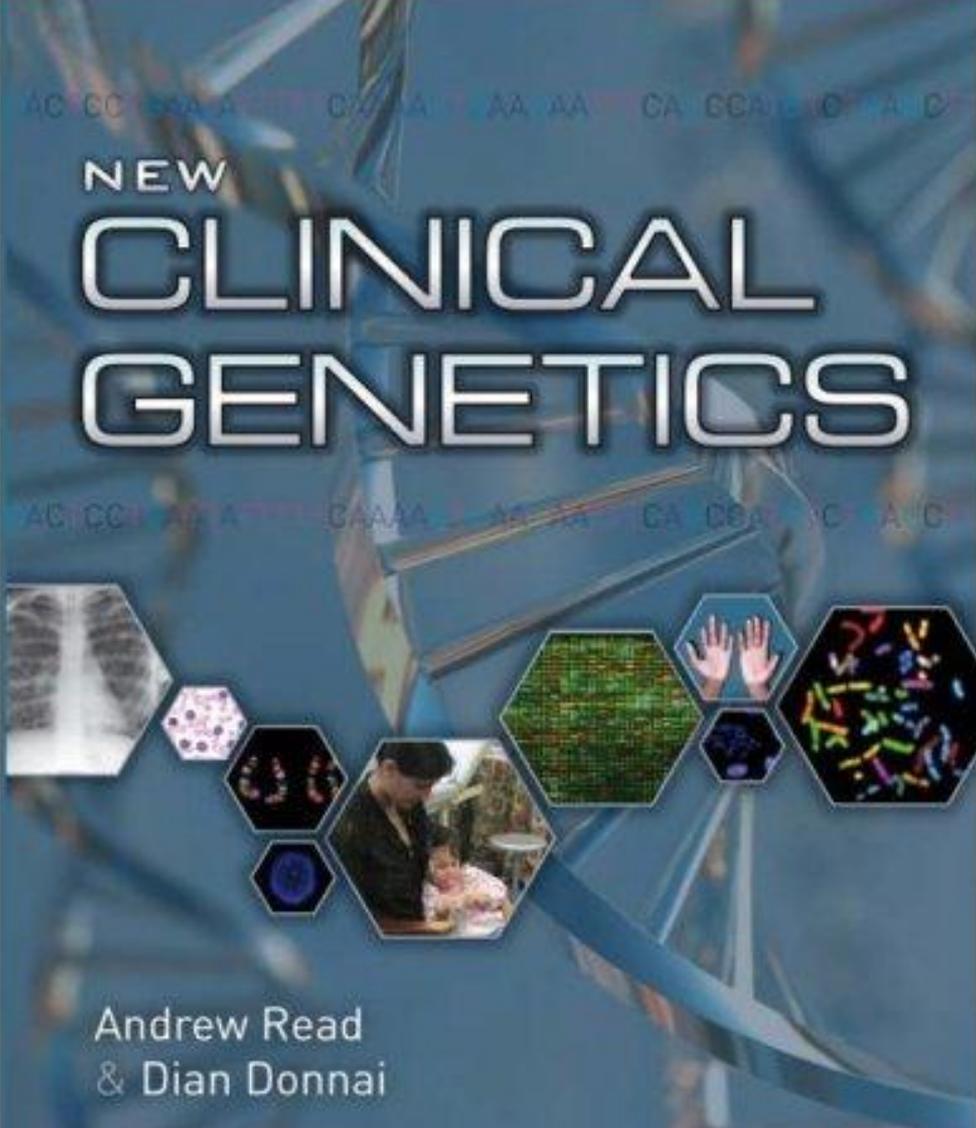

South East of Scotland  
Clinical Genetics Department  
Western General Hospital

Semester 2 - 2014

## Overview

- 9 lectures
- 3 tutorials
  - Case orientated
- 2 PBLs

GENETICS**

AC CGG A A G G A A A A A CA CGA C A C

The book cover features a central DNA double helix structure. Below it, a series of hexagonal frames contain various images: a chest X-ray, a microscopic view of cells, a karyotype, a person holding a baby, a green grid pattern, a pair of hands, and a colorful karyotype. The authors' names are at the bottom left.

# The family history

# Why take a family history?

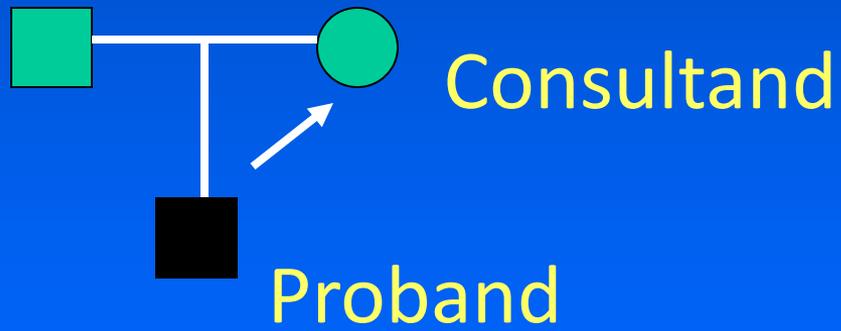

- Aid in diagnosis
  - Identify the spectrum of illnesses/medical diagnosis within the family
  - Demonstrates mode of inheritance of disease in family

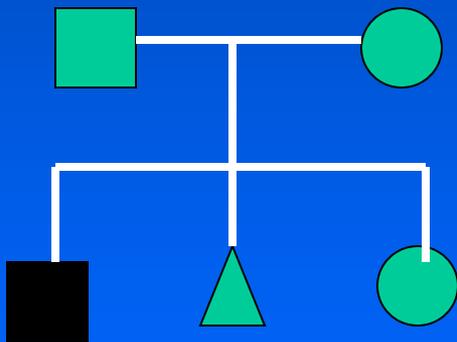

# Why take a family history?

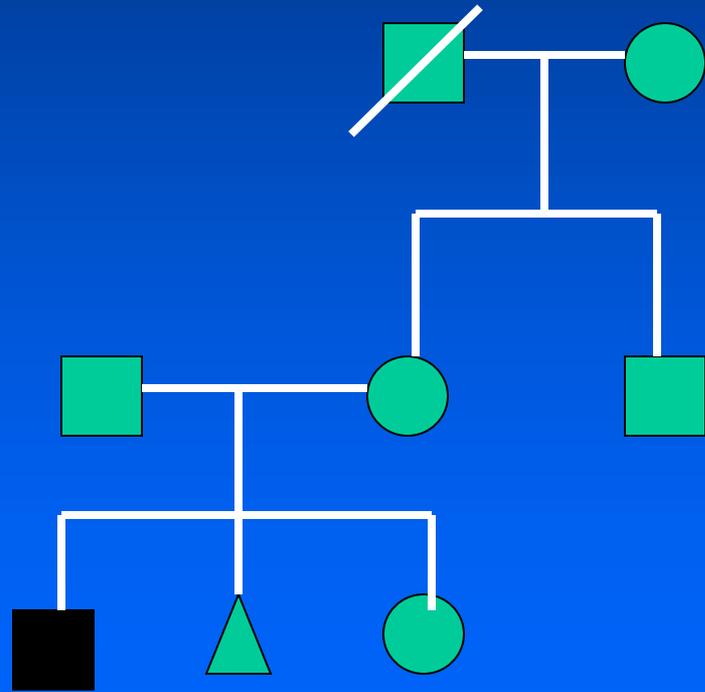

- Establishes rapport between consultand and counsellor
- Identifies consultand's concerns and perceptions
- Provides information on family relationships

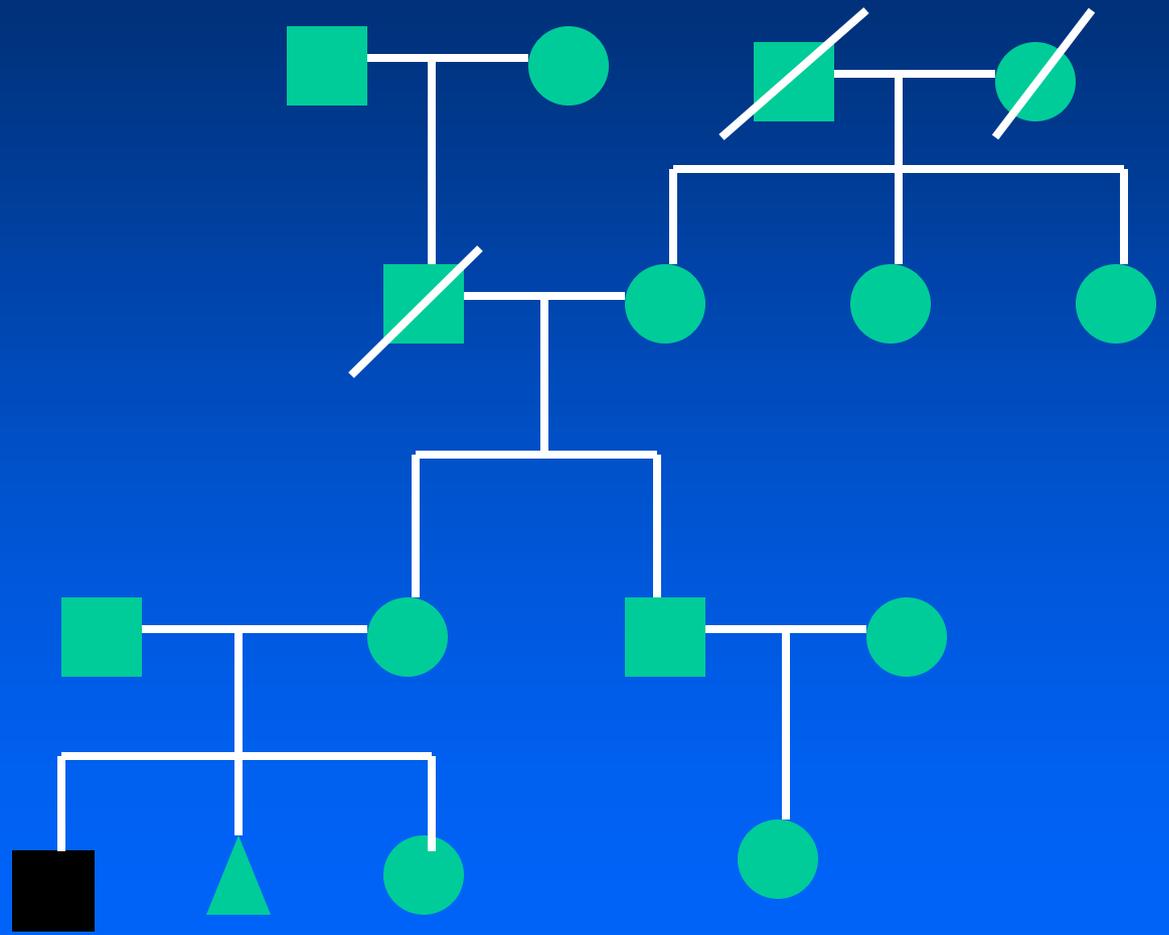

# Information to be collected

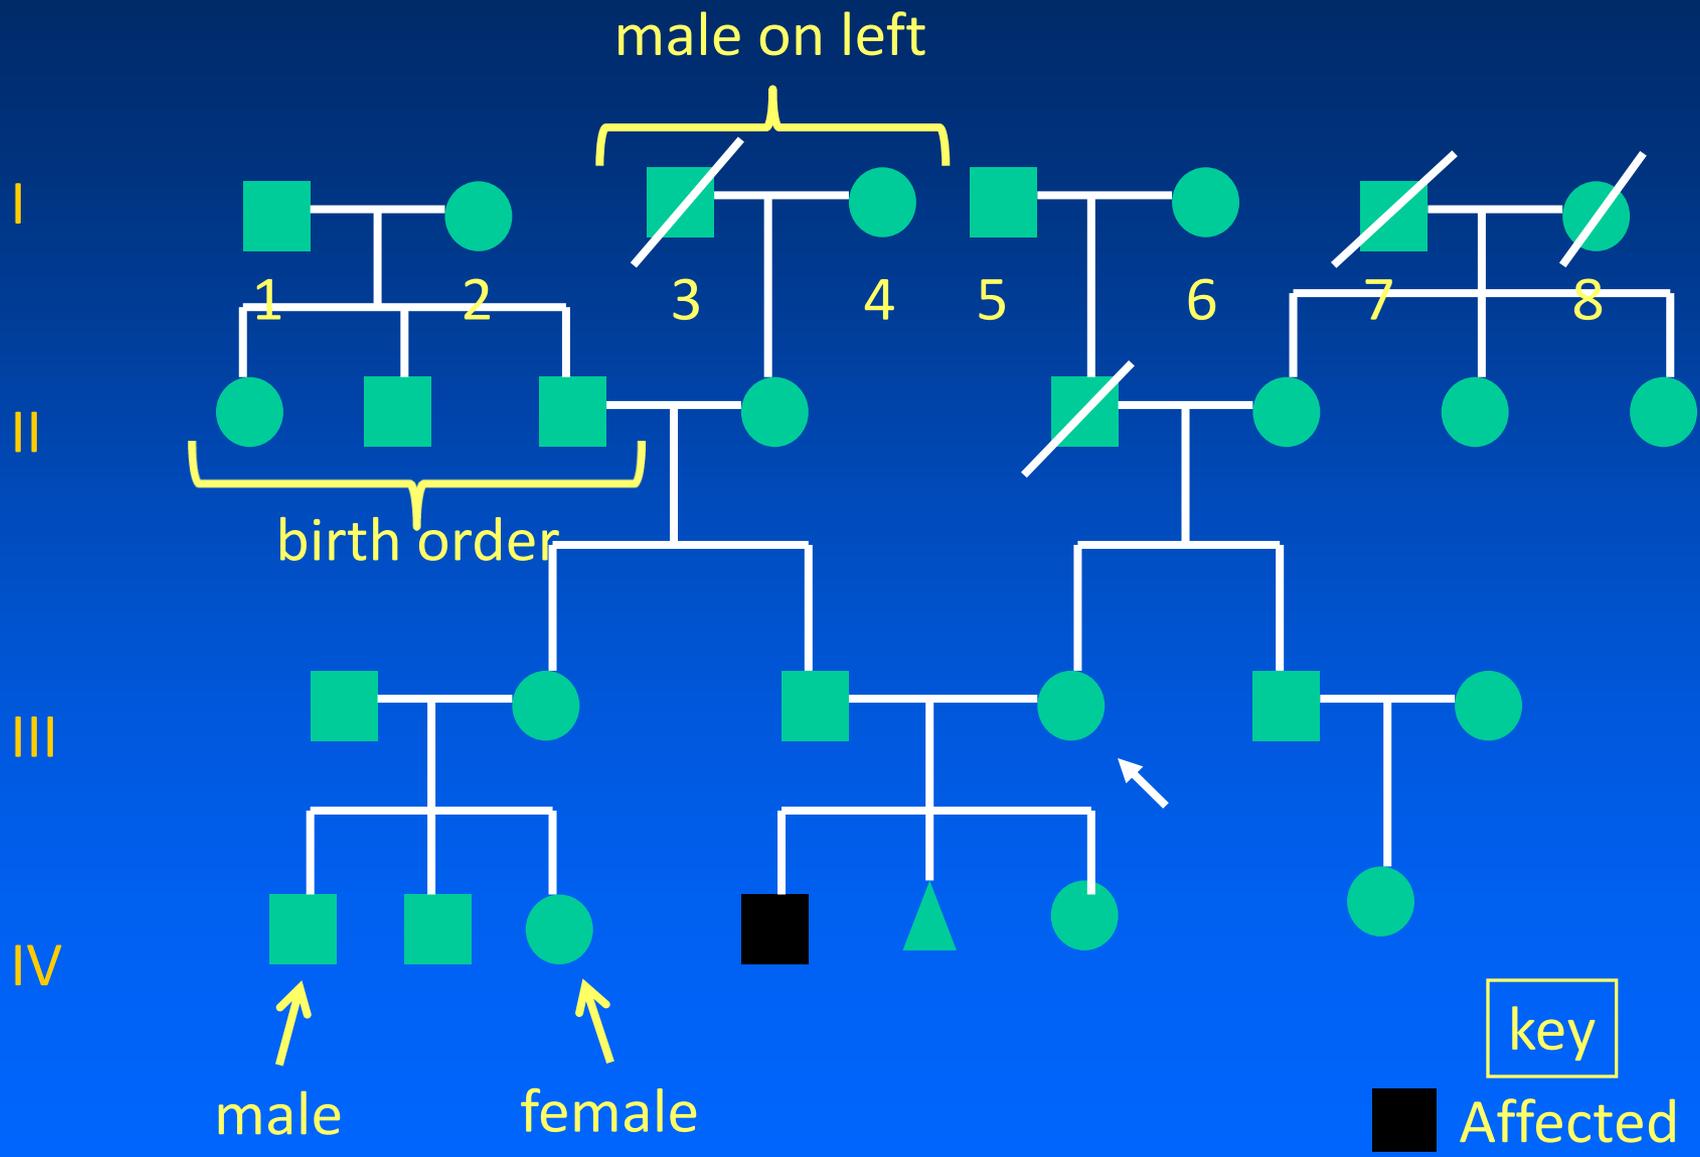

- Full name (including maiden name)
- Date of birth
- Date and cause of death
- Number of children and miscarriages
- Any specific medical diagnoses

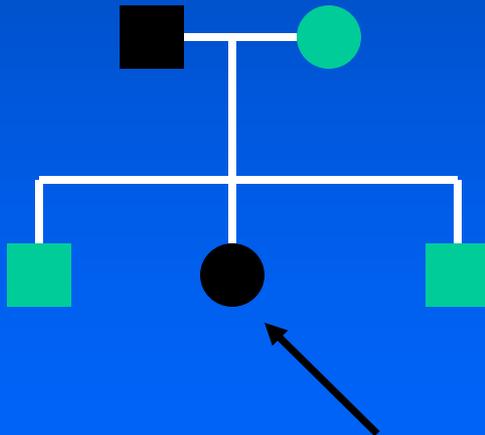

# Standard symbols used in drawing a family tree

	Male	Female	Sex unknown	Pregnancy	
Individual					
Affected individual					
Two or more conditions					Key: eg. colour blindness cystic fibrosis
Multiple individuals					Number inside symbol
Deceased individual	 d. 35 yr.	 d. 4 mo.	 d. 1936		
Stillbirth	 SB 28 wk	 SB 30 wk	 SB 34 wk		
Consultand (individual seeking genetic counselling)					
Proband (first affected member coming to medical attention)	 P	 P			

22 year old presented with acute gastrointestinal bleed

■ Affected

# Autosomal Dominant Inheritance

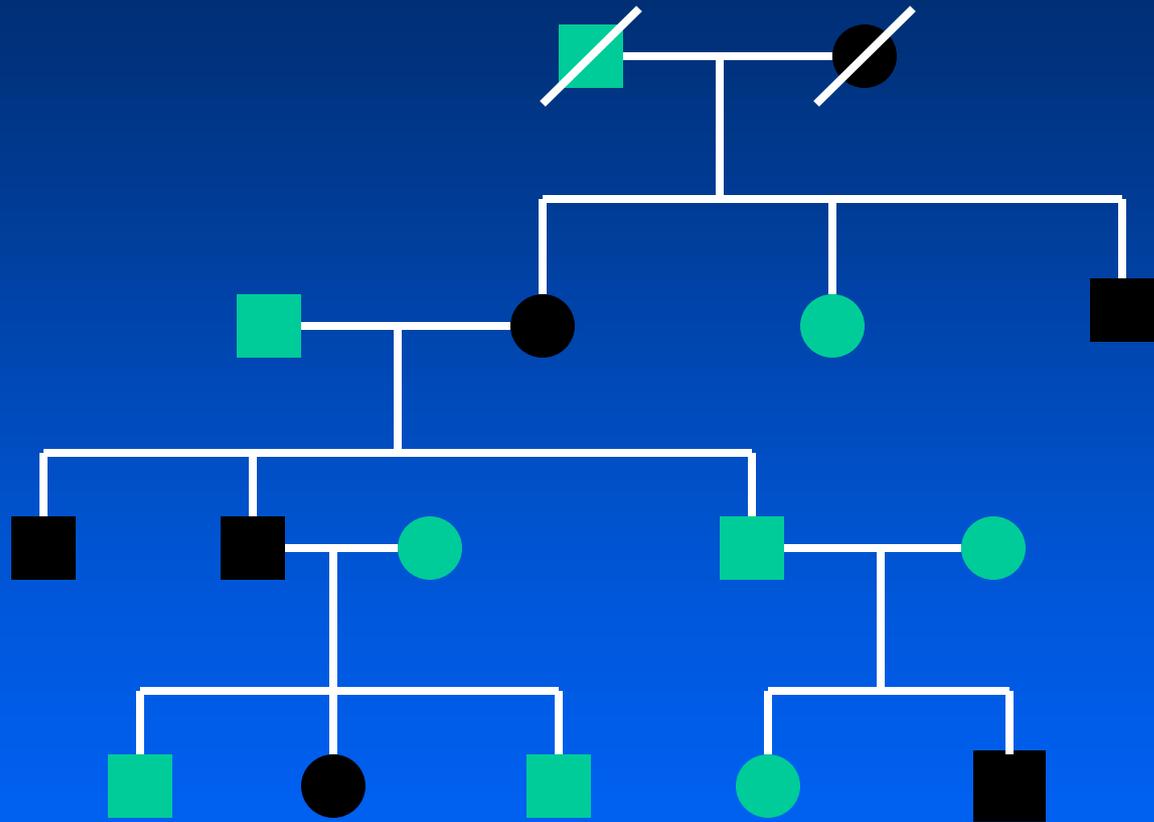

- involvement of more than one generation
- male to male transmission
- males and females affected equally

■ Affected

# Autosomal Dominant Inheritance

- 2 further characteristics

# Autosomal Dominant Inheritance

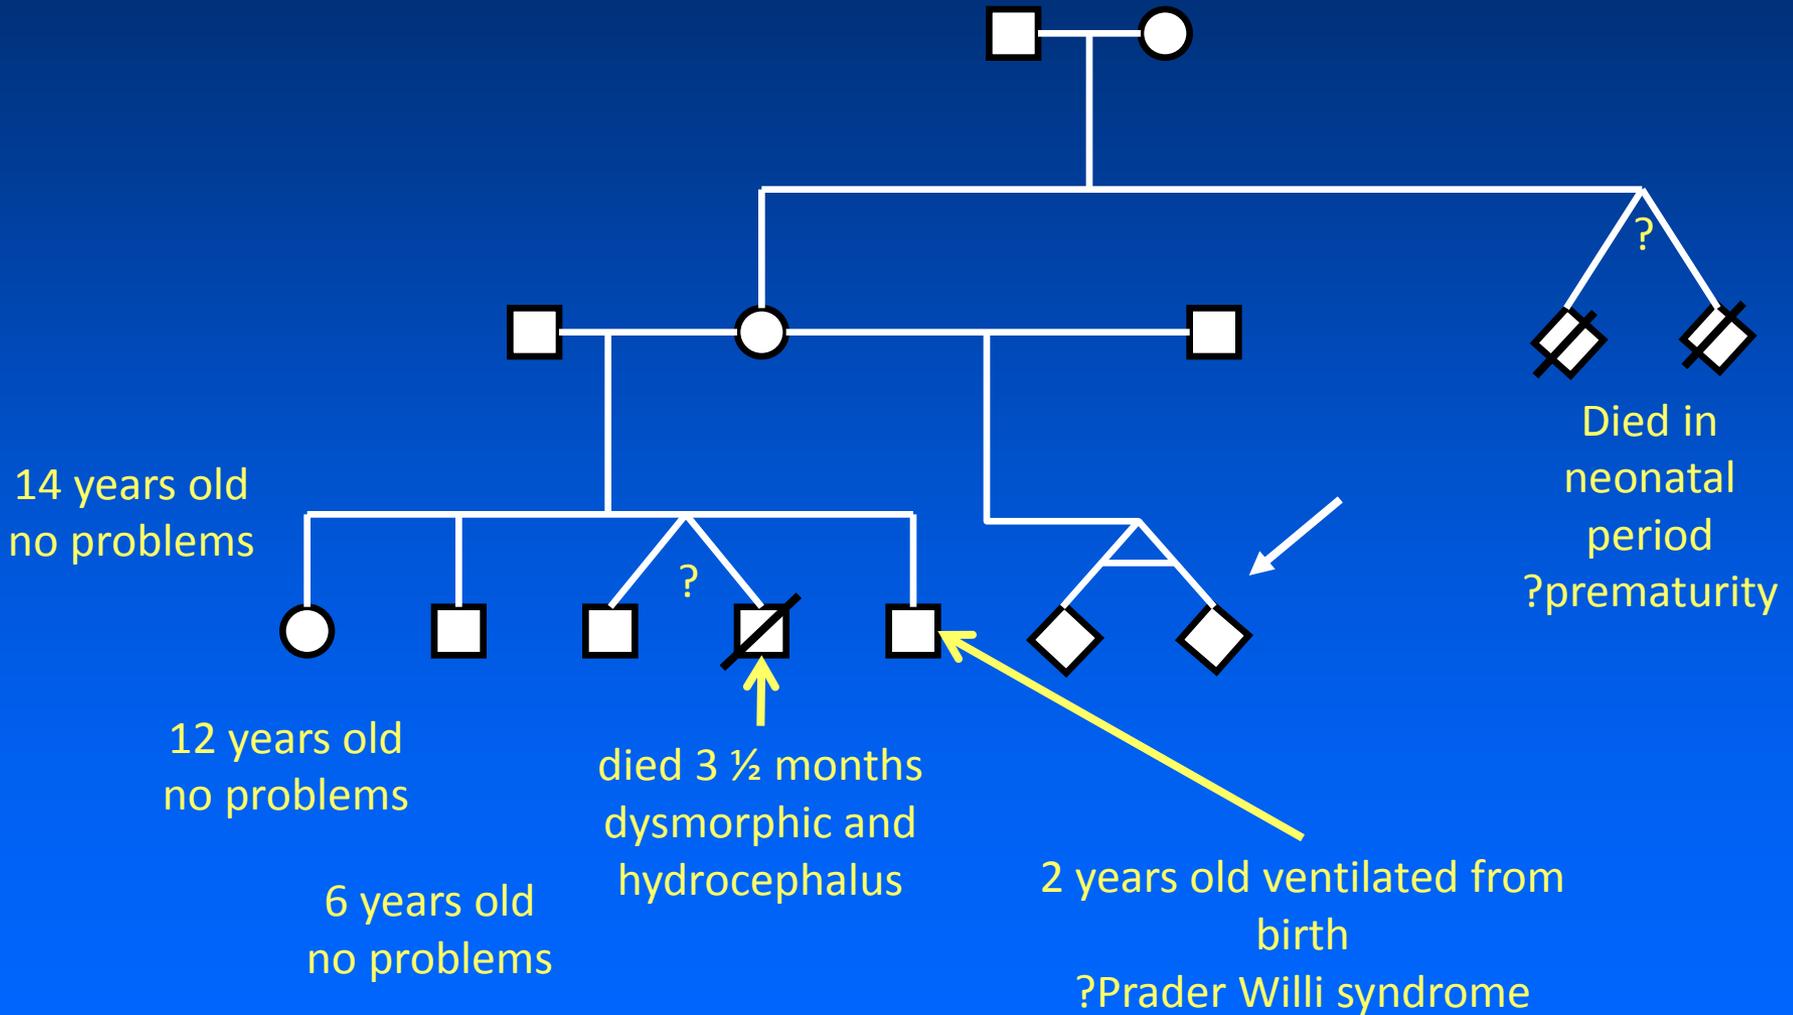

Non-penetrance

■ Affected

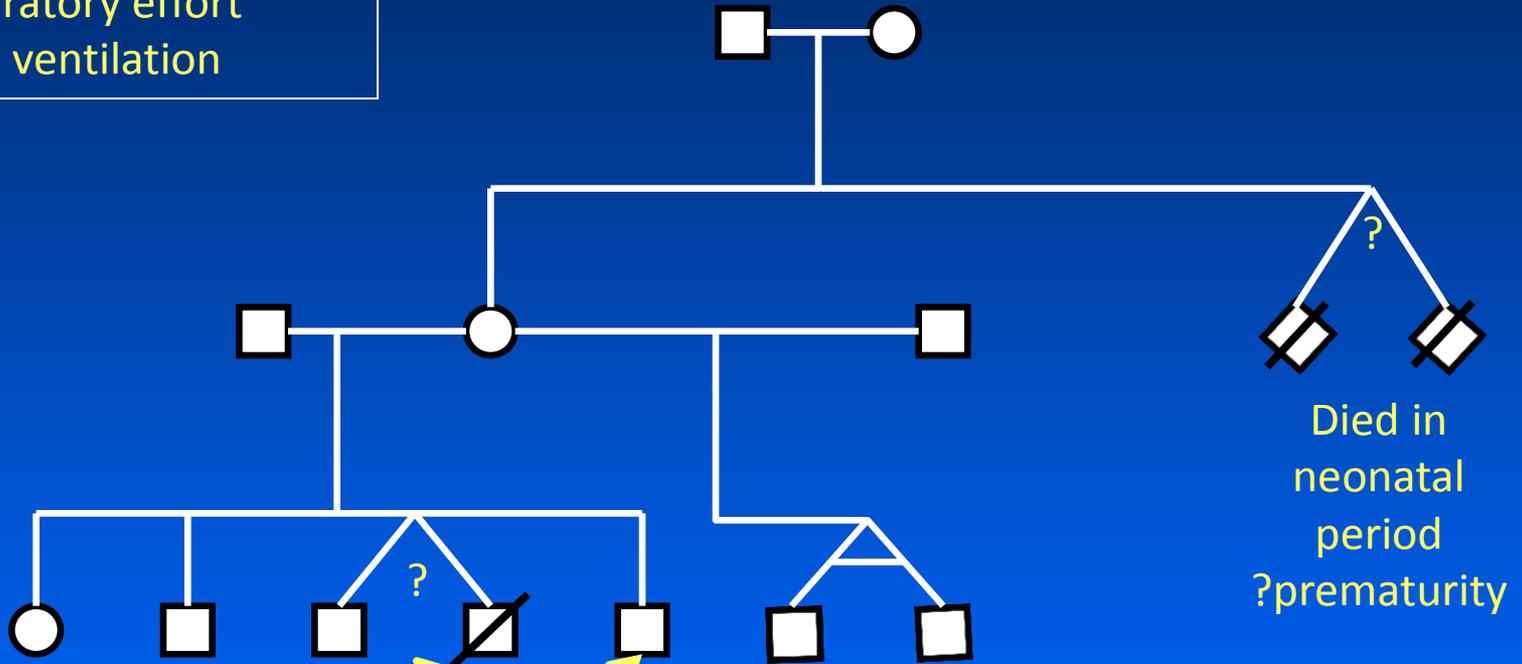

# Autosomal Dominant Inheritance

- Penetrance
  - affected person may or may not develop symptoms or show signs of the disorder  
“skipping a generation”
- Expressivity
  - variation in the clinical presentation/phenotype between patients

# Polish couple referred for antenatal counselling

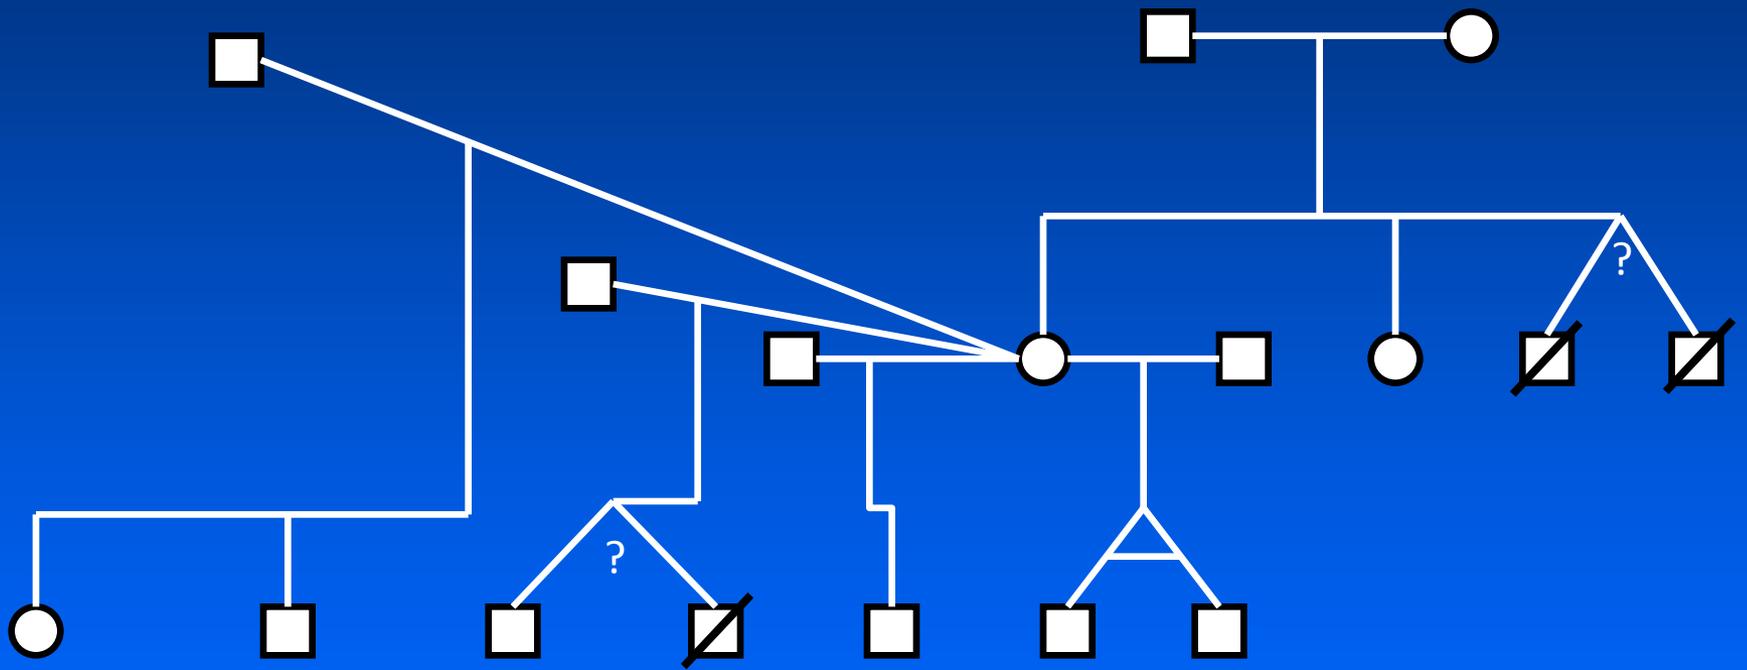

Twins born 33 weeks premature  
Severe hypotonia  
No respiratory effort  
Require ventilation

Died in neonatal period  
?prematurity

died 3 ½ months  
dysmorphic and  
hydrocephalus

2 years old ventilated from  
birth  
?Prader Willi syndrome

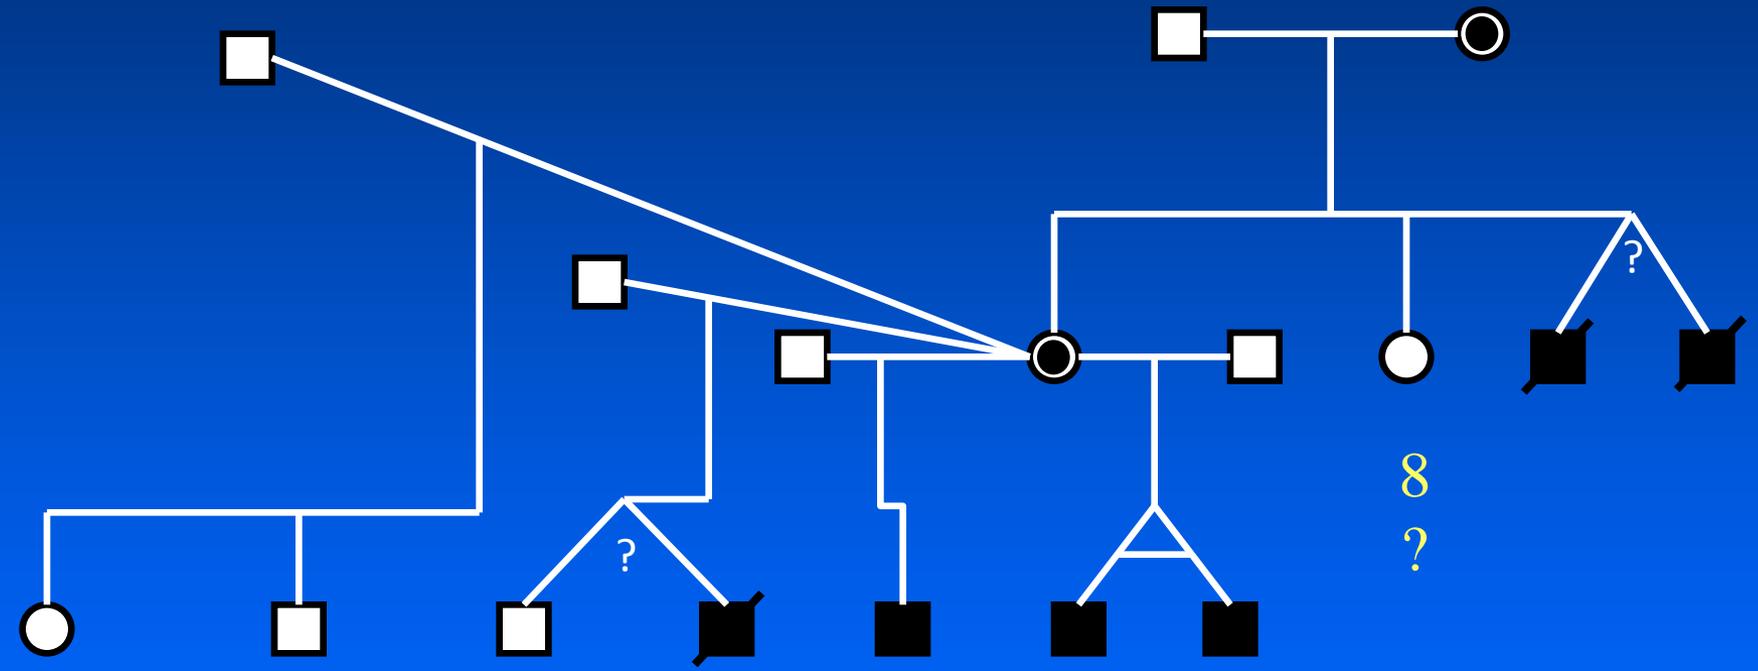

# Fragile X Syndrome

- 1:4000
- Commonest none chromosome cause of mental retardation
- Mild to severe mental retardation
- Macroorchidism (post pubertal)
- Long face, prominent jaw, thick nasal bridge, large ears
- Joint hypermobility
- Autistic features, ADHD

# X-inactivation

- Carrier females can be affected by X-linked disorders
- Consequence of the process called X-inactivation or Lyonization
- It is an random process
- If in an excess of cells, the normal X chromosome has been switched off then a female carrier of an X-linked disorder can be affected

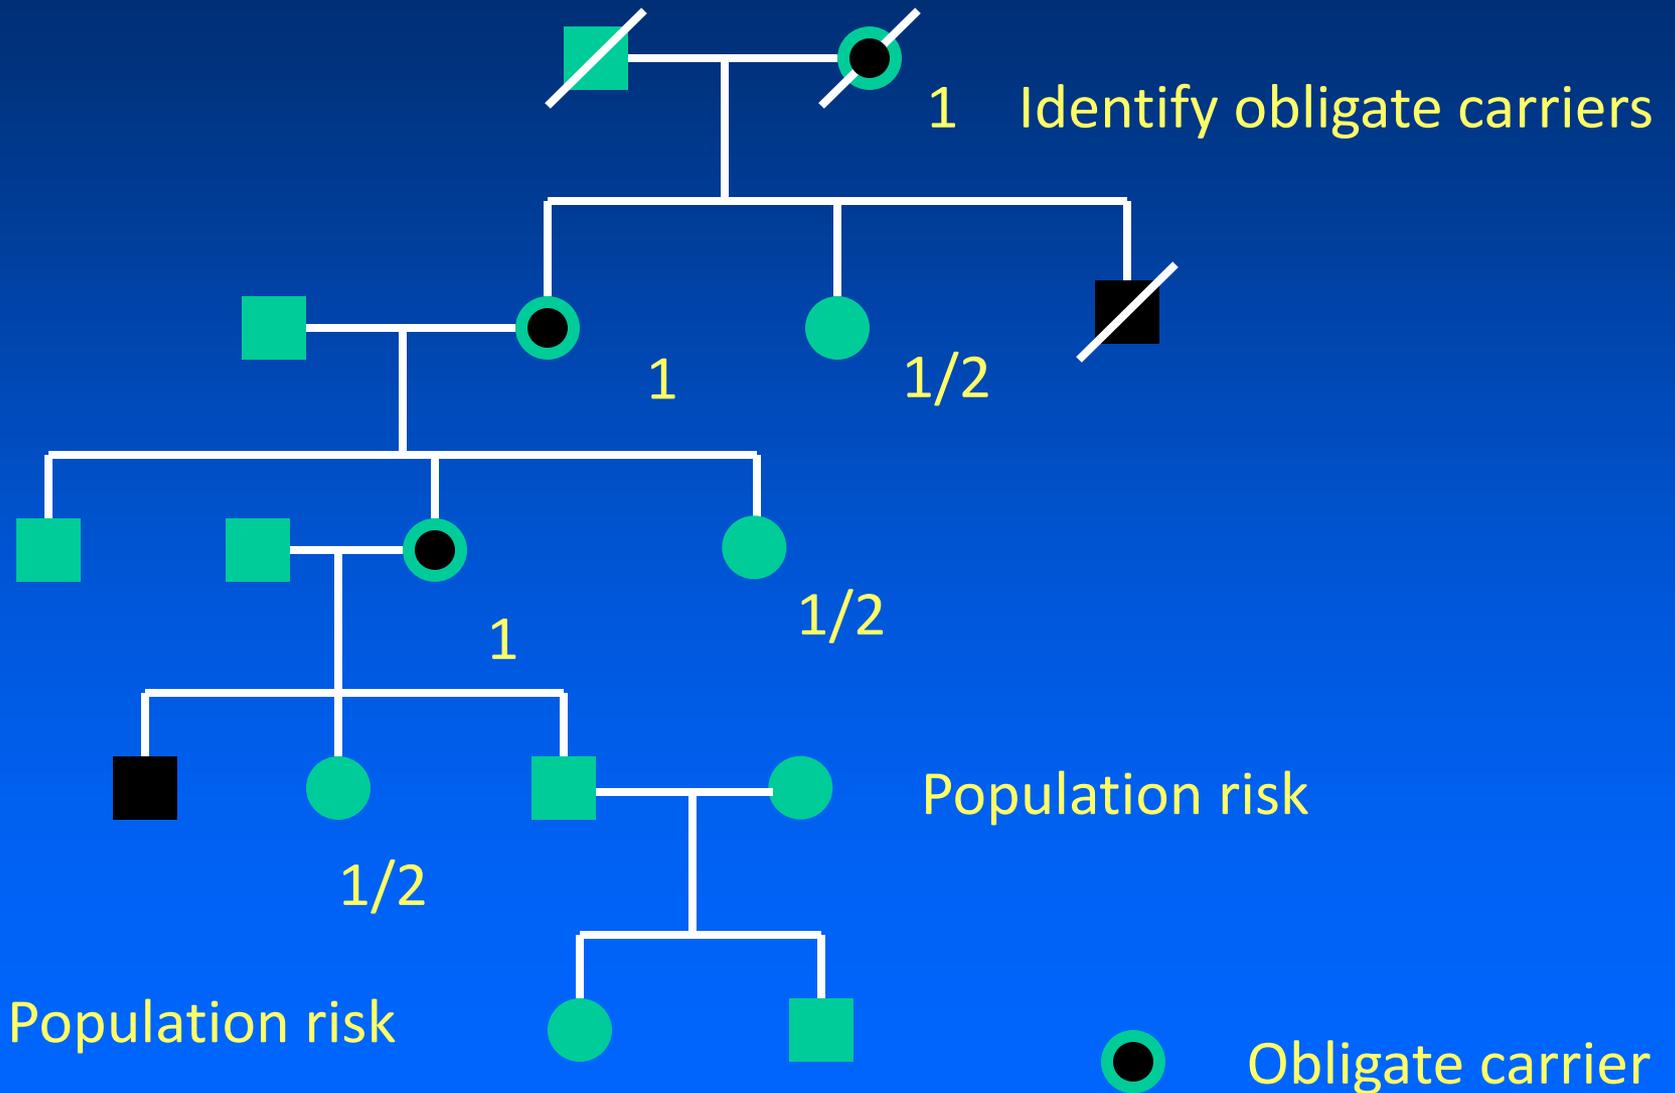

# Identify obligate carriers

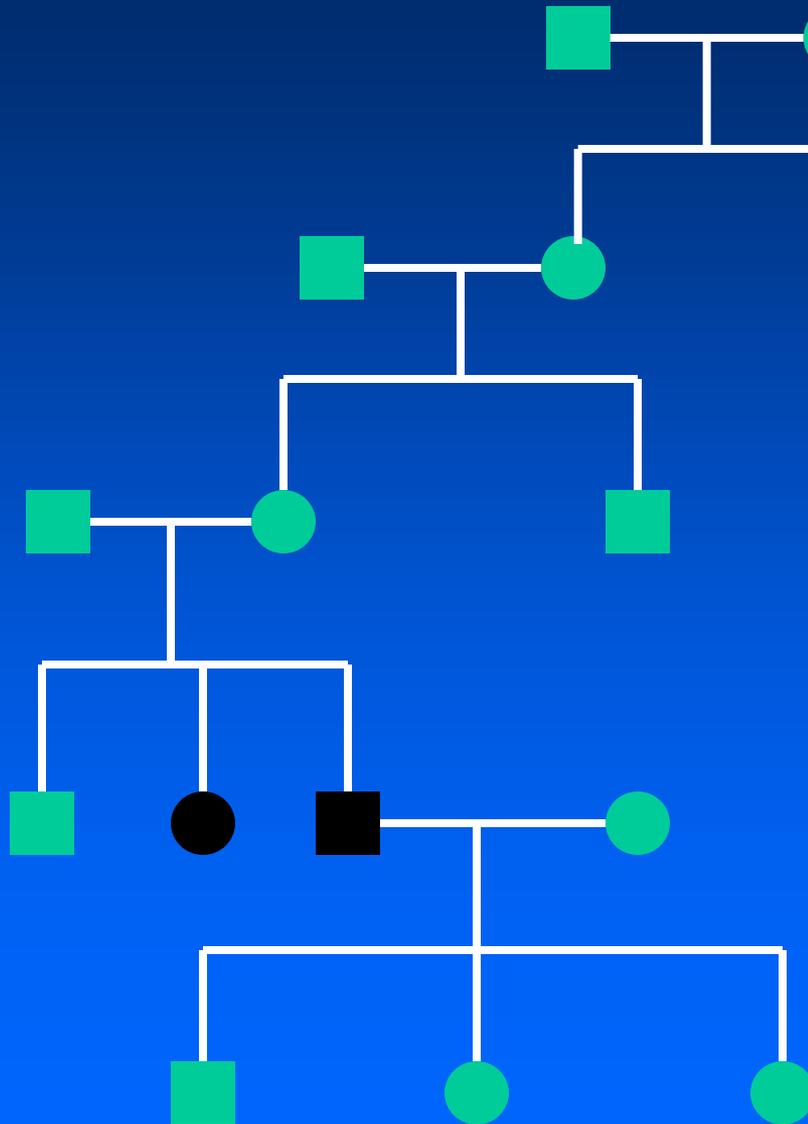

1/2

8 ?

# X-Linked Inheritance

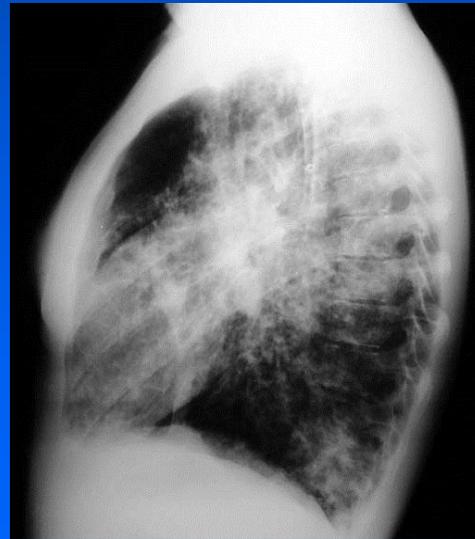

# Autosomal Recessive Inheritance

- one or more affected children with unaffected parents
- usually only one generation affected
- males and females affected with equal frequency and severity
- a higher incidence of consanguinity

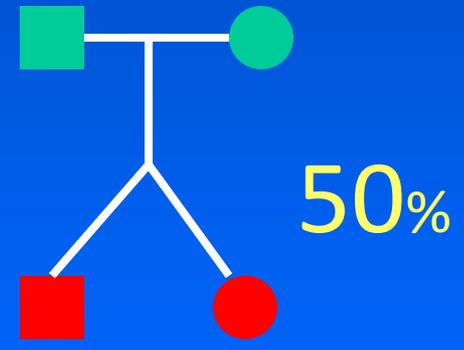

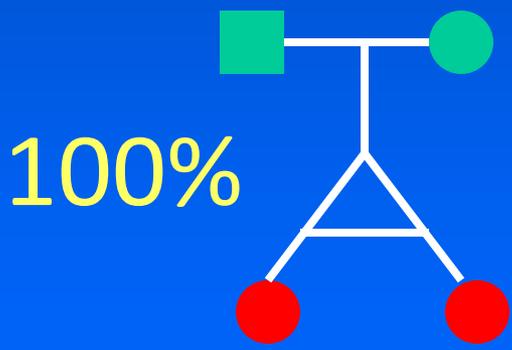

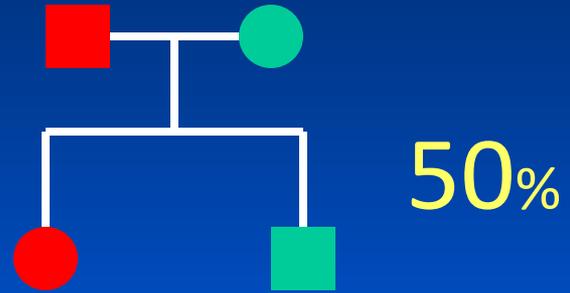

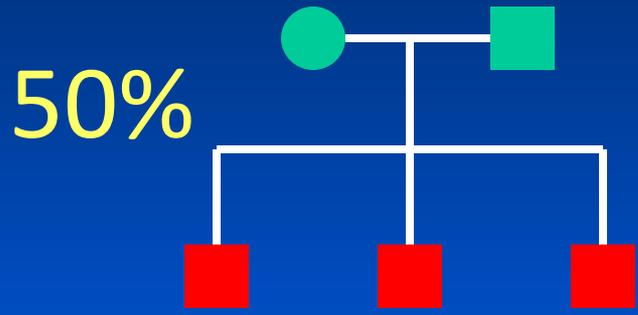

# Cystic Fibrosis

Disease onset in childhood

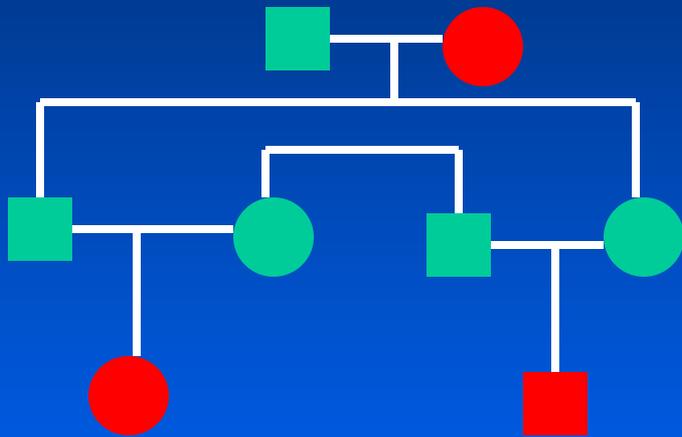

- Recurrent chest infections
- with progressive Loss of Lung Function
- May present with failure to thrive secondary to pancreatic insufficiency

# First degree relatives

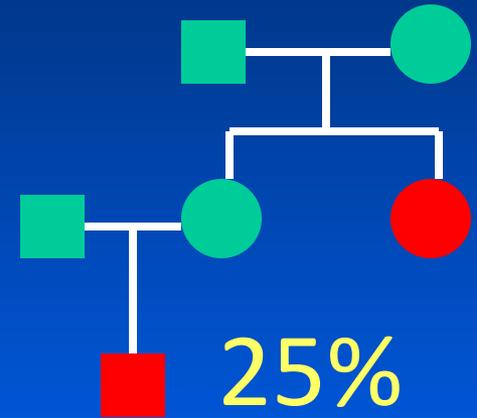

Percentage of genes shared 

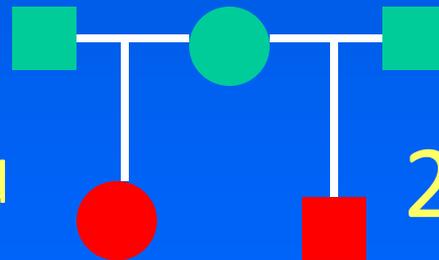

# Second degree relatives

25%

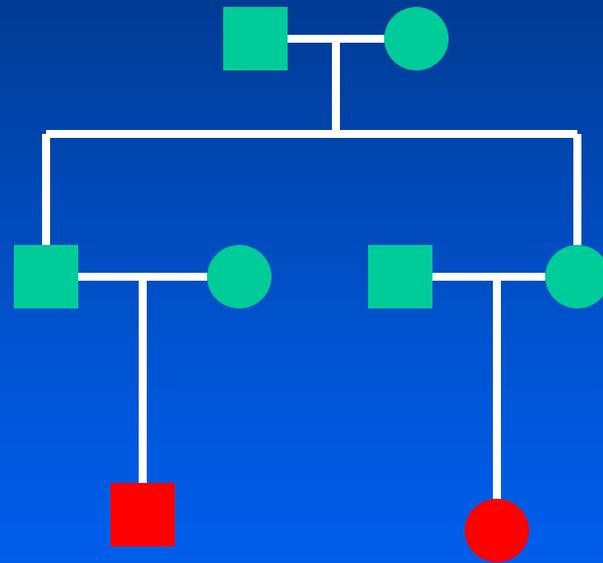

25%

25%

Percentage of genes shared

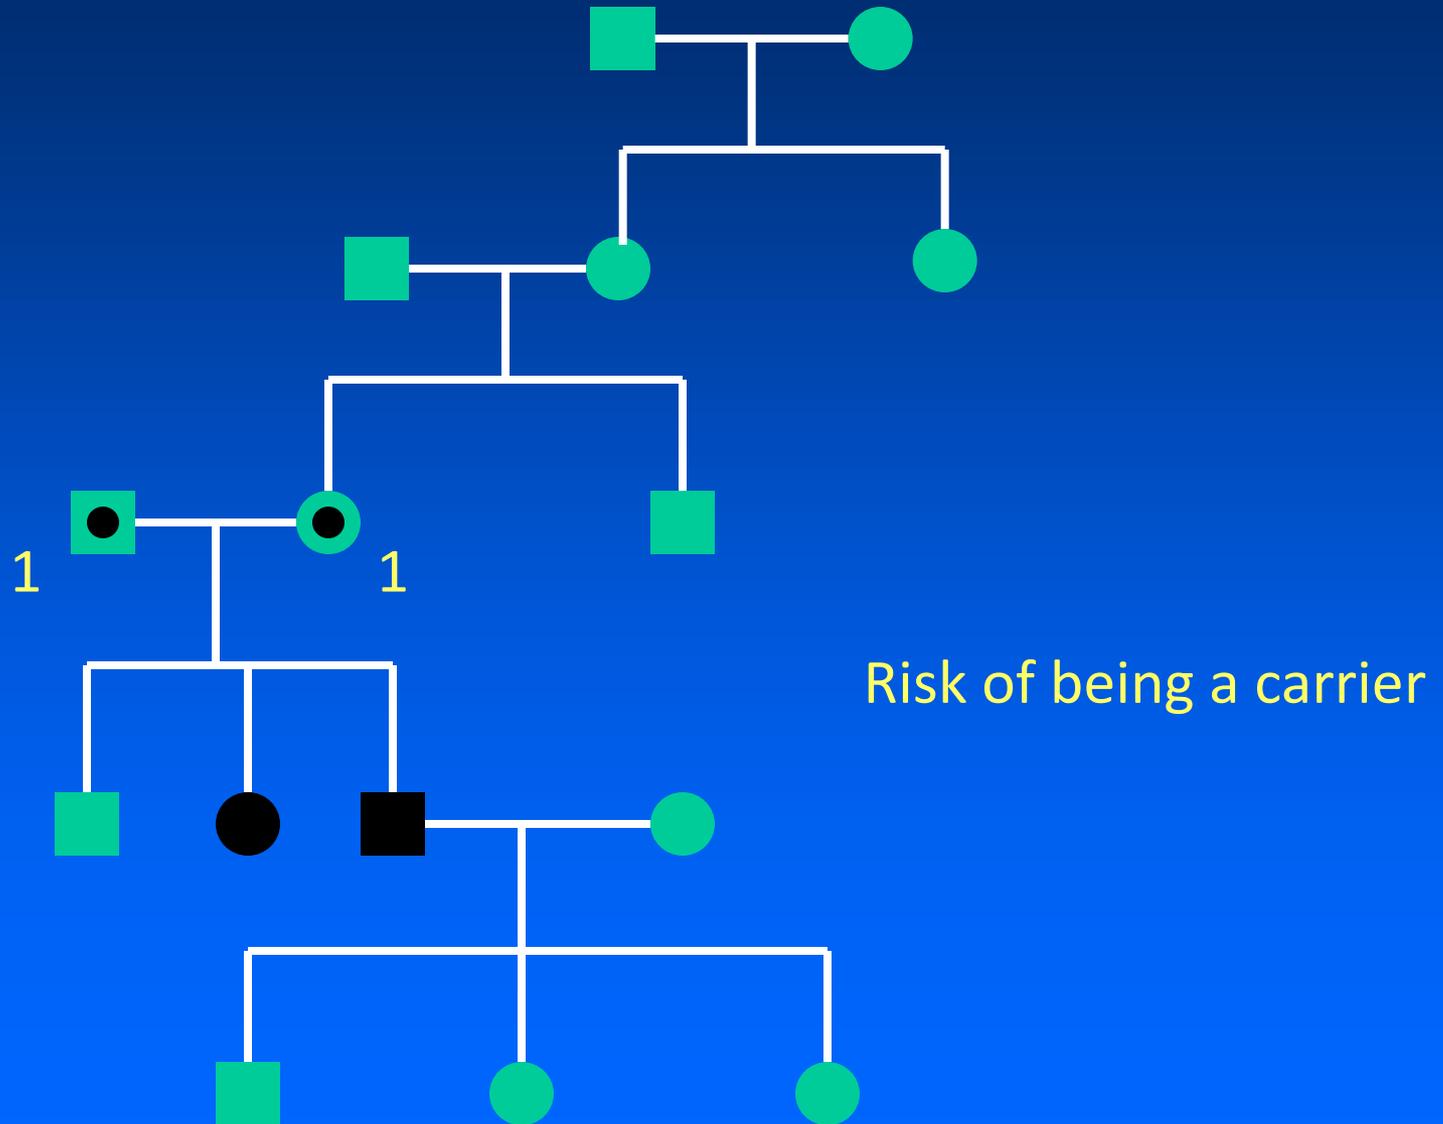

# Third degree relatives

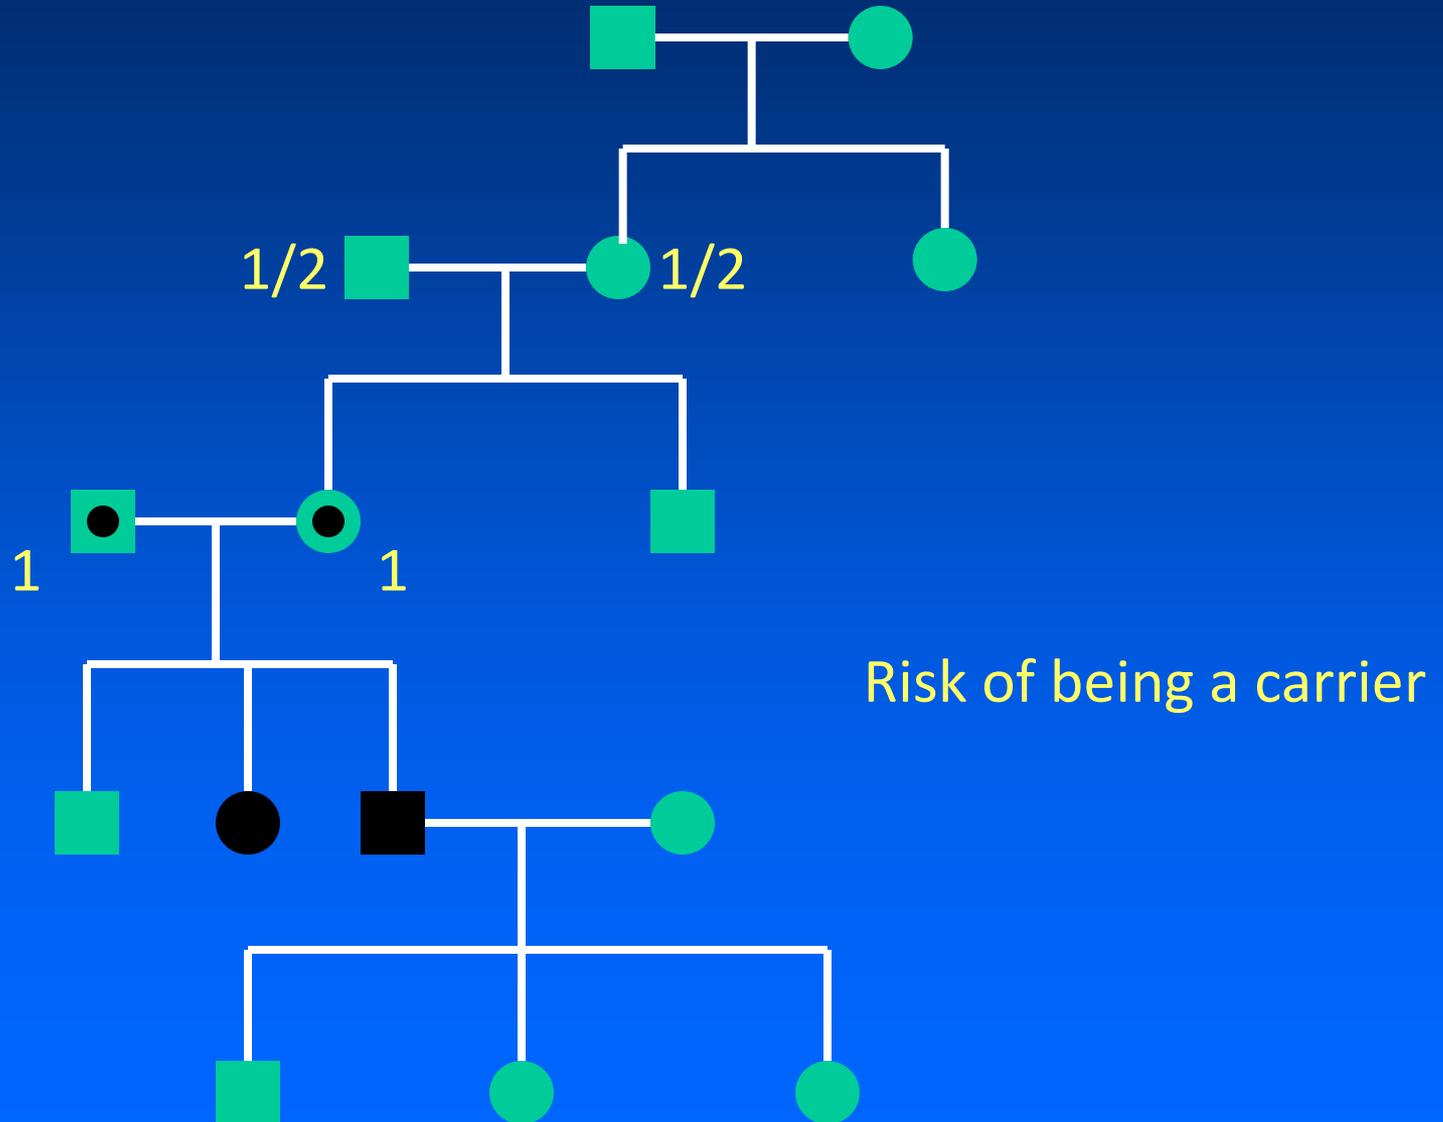

12.5%

Percentage of genes shared

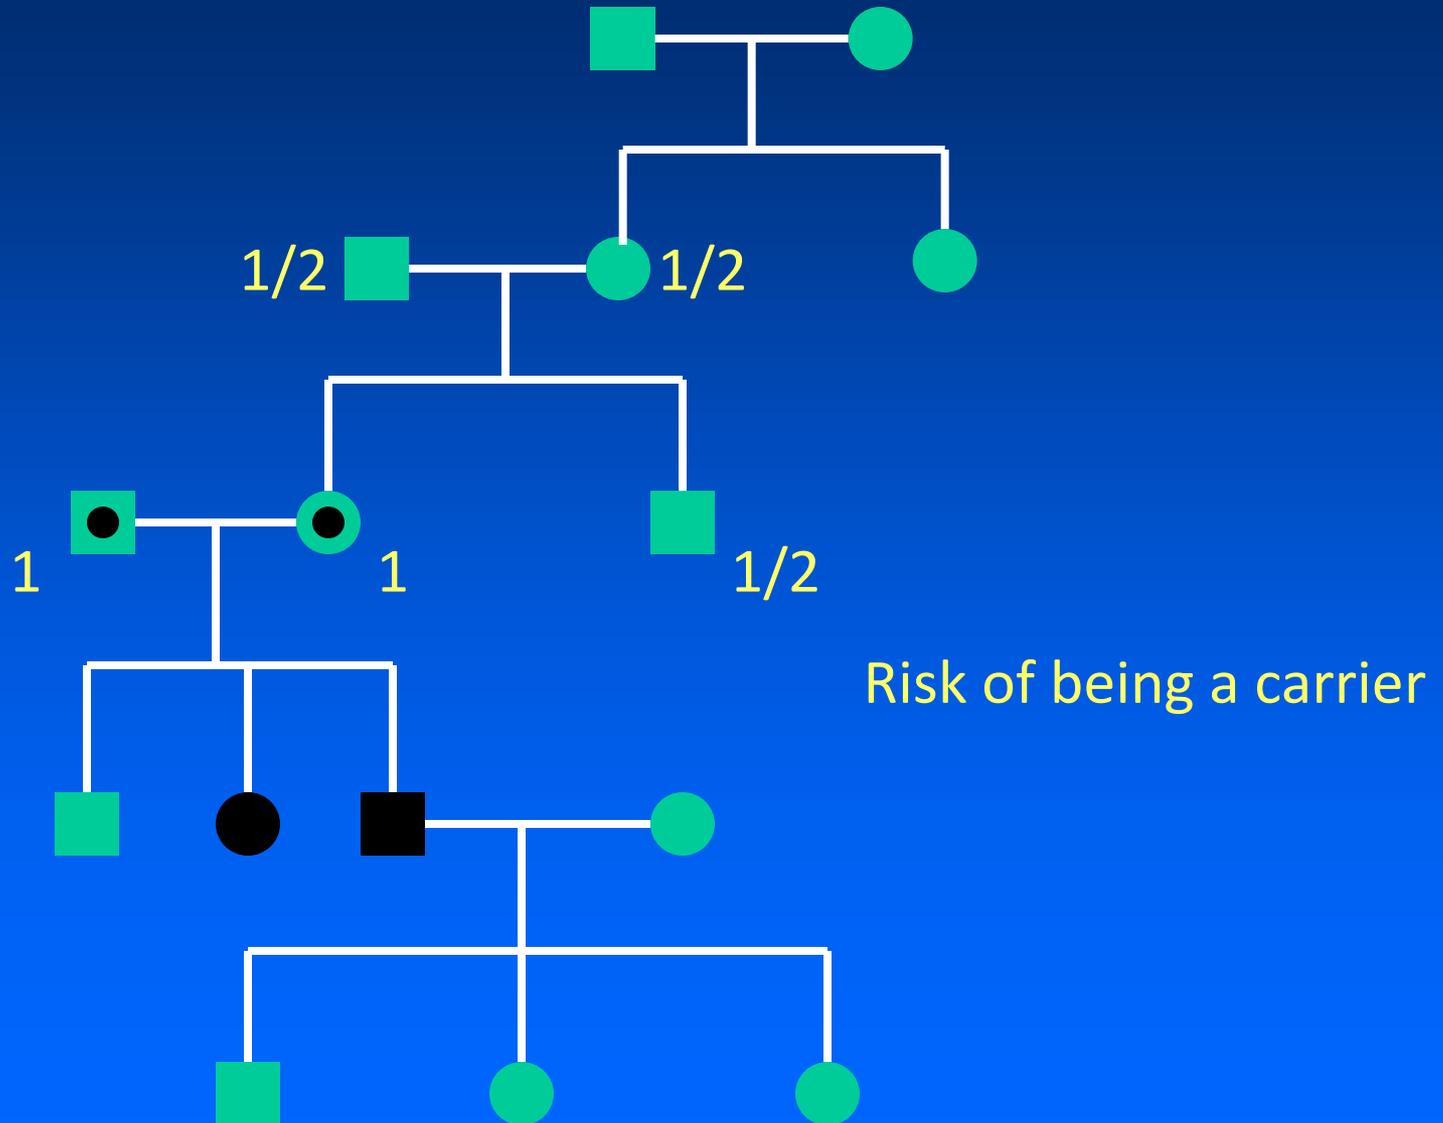

# Autosomal Recessive Inheritance

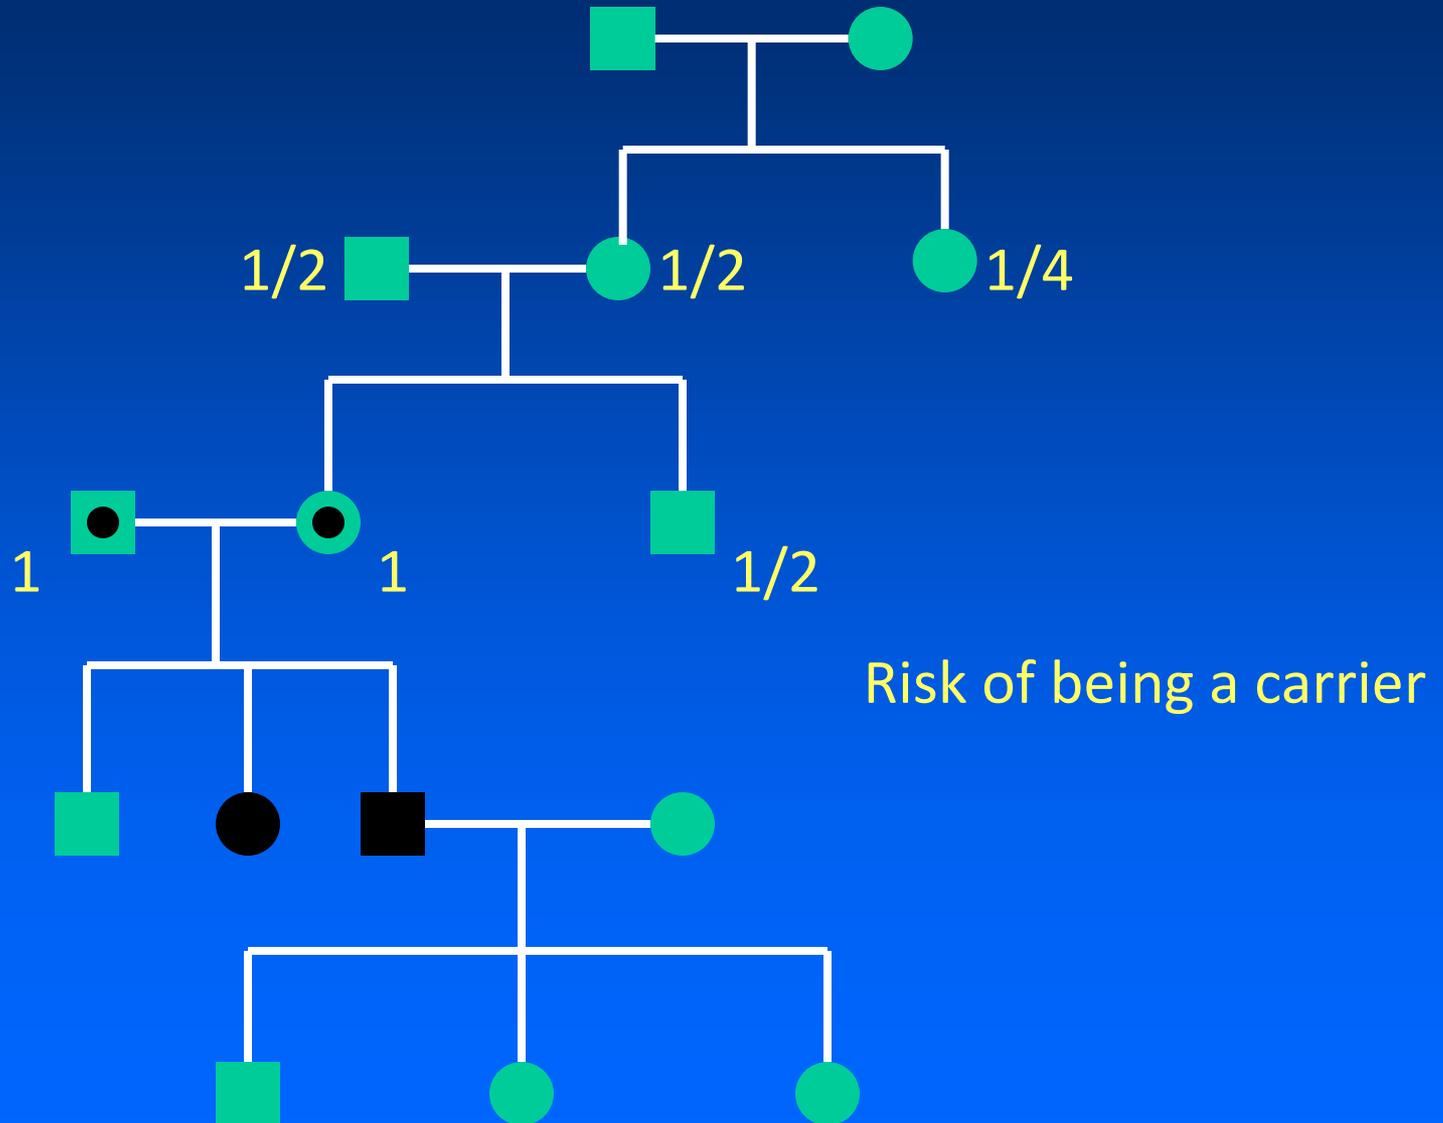

# Autosomal Recessive Inheritance

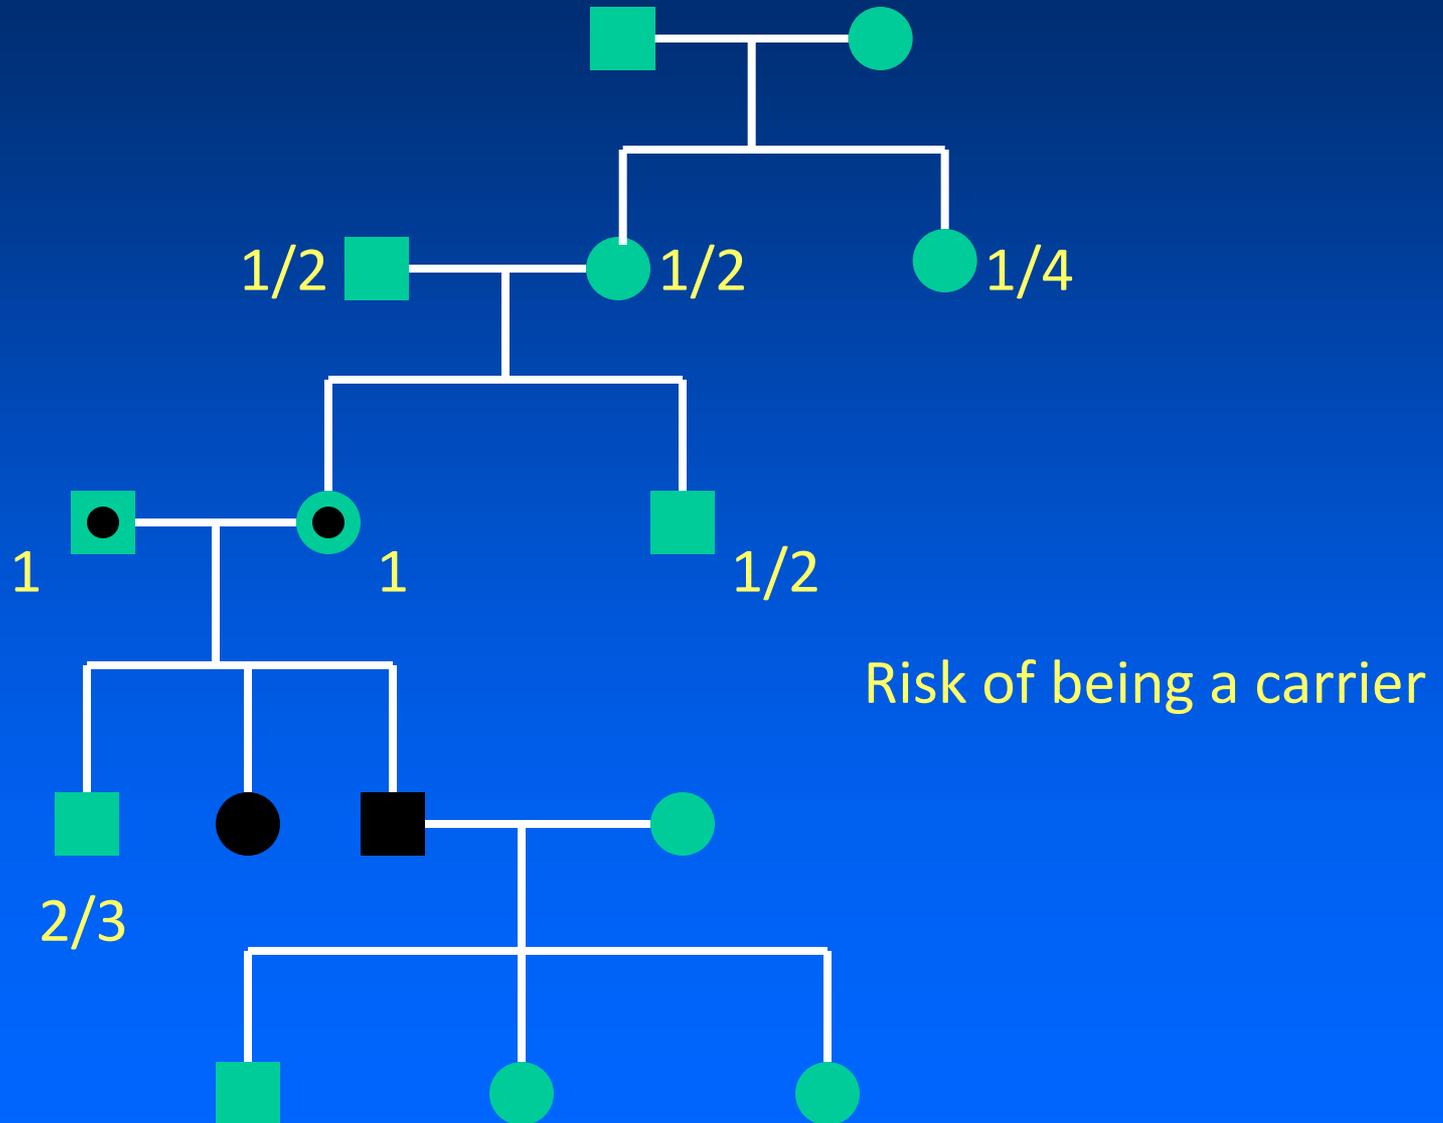

# Autosomal Recessive Inheritance

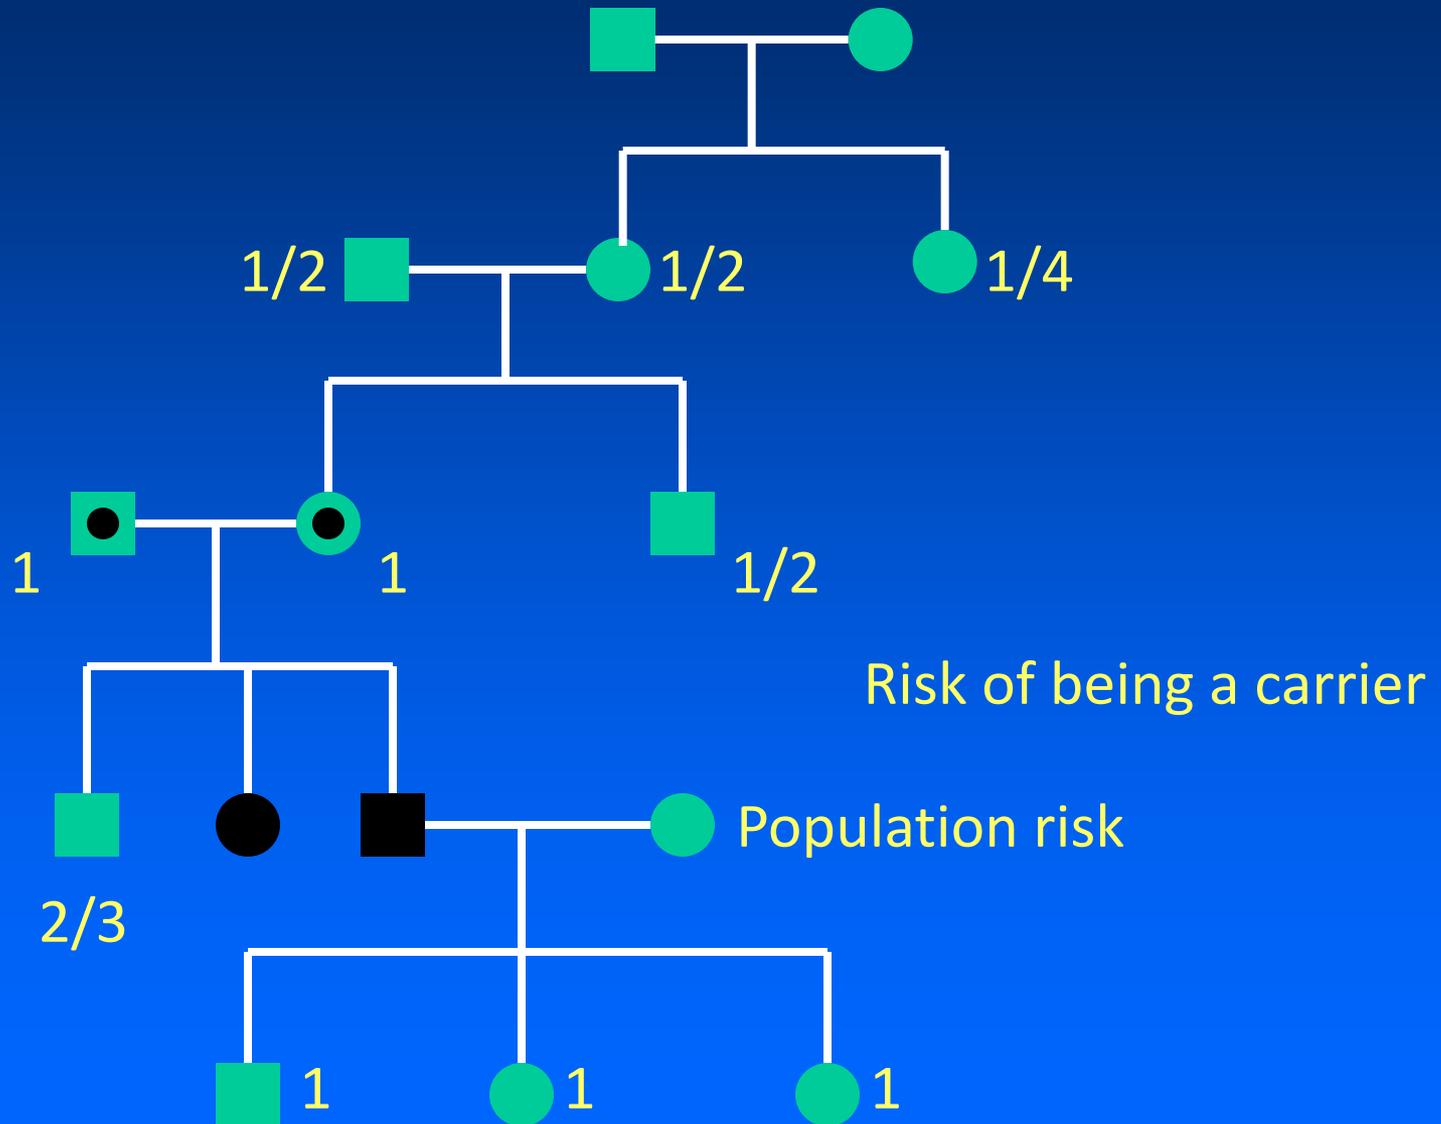

# Autosomal Recessive Inheritance

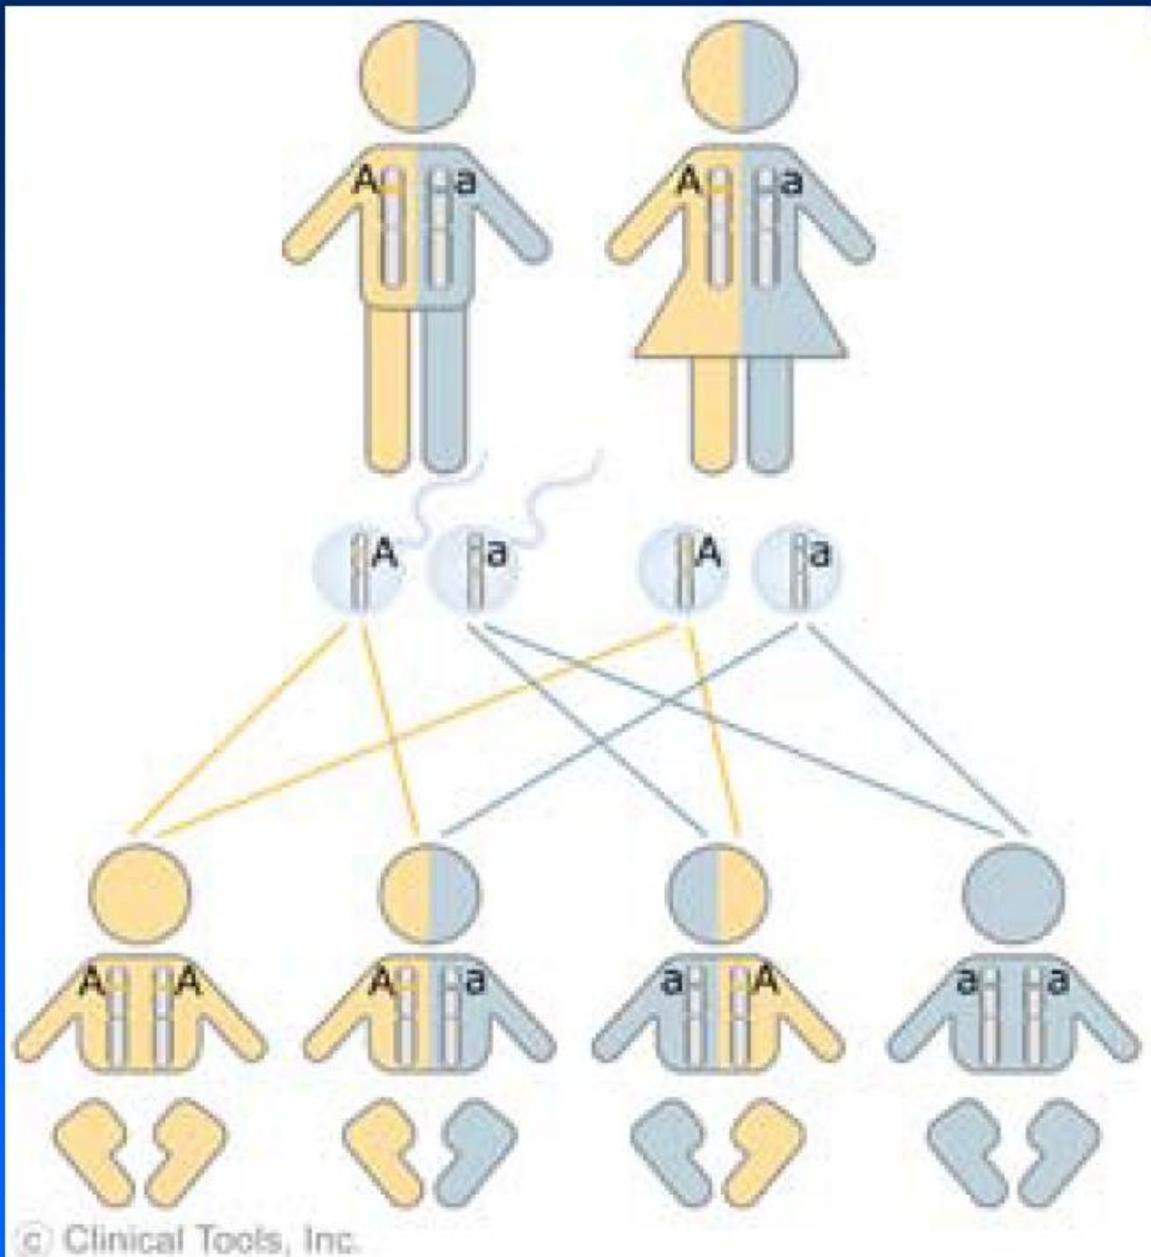

# Autosomal Recessive Inheritance

# Autosomal Recessive Inheritance

Why 2/3?

# Population risk?

## Hardy-Weinberg Principle

“Where in a randomly mating large population with no outside influences, the relative proportion of genotypes for any condition remains constant from one generation to another”

# Population risk?

## Population carrier frequency

Requires 2 disease alleles for manifestation of condition

- Therefore if  $p$  = normal allele  
 $q$  =disease allele

- Use Hardy-Weinburg Equilibrium

$$p^2 + 2pq + q^2 = 1$$

$$p + q = 1$$

Proportion of  
the population  
who are  
unaffected

Proportion of  
the population  
who are  
carriers

Proportion of  
the population  
who are  
affected

ie disease  
incidence

# Example calculation

- Disease is present in  $1/10,000$  population
- $q^2 = 1/10,000$  so  $q = 1/100$   
 $p + q = 1$
- $p = (1-q) = 1 - 1/100 = 99/100 \sim 1$
- $2 \times p \times q = 2 \times 1 \times 1/100$
- $2pq = 1/50$
- $1/50$  of the population carry the faulty gene

# What is genetic counselling?

- The process by which patients or relatives at risk of a disorder that may be hereditary are advised of the consequences of the disorder, the probability of developing or transmitting it, and of the ways in which this may be prevented, avoided or ameliorated

– Peter Harper

# What is genetic counselling?

Help individual or family to:

- **comprehend the medical facts**, including the diagnosis, probable course of the disorder and the available management
- **appreciate the way heredity contributes to the disorder** and the risk of recurrence in specified relatives
- **understand the alternatives** for dealing with the risk of recurrence
- **choose the course of action** which seems to them appropriate in view of their risk, their family goals and their ethical and religious standards and to act in accordance with that decision
- **make the best possible adjustment** to the disorder in an affected family member and /or the risk of recurrence of that disorder
